

## Executive Summary

Fork Repository: <https://github.com/honeepuffs/munch>

I have collected the data on the contributions for the scottab/rootbeer repository. I collected data from 30 source files and found 403 commits across 18 authors. I have compiled this information into a scatter plot showing the author who committed and when. Scott Alexander-Brown and Matthew Rollings has particularly been an asset to this team, consistently working across all of the files over the whole duration of this project. A number of developers have stopped working on the project for the past couple years. I found there are developers like Andy Barber, ledocadiotine, and many other developers committed very few during the project and perhaps they can be directed elsewhere helping in other projects.

If we would like to add more developers onto this team, we should note the main languages of proficiency to be in Java and Kotlin. As time goes on less and less commits are being made, so perhaps we should look towards new updates or minimizing the team for routine maintenance going forward.

I found git add particularly useful in this lab. This showed me where my repository was, if it was out of sync with the main branch, if my folder was not attached to my repository. It showed me if I needed to update my branch, and if I was ready to commit my changes to my branch. Git add directed me to all of the other commands I needed to use for this lab
